

## HTML->DOCX

The WP site has wp\_jobmanager installed with the add-on job-manager-resume. This resume-add-on works with template files (see `templatecode.php`) which loads content from the database and renders html which you can see in `sourcecode_output.html`. Below you see the output on screen.

For the implementation:

It does not need to be a plugin at the end. It also can be a function which could be hooked into the function which shows the other links (see the template file).

The code has to be implemented in that template file, since this template file renders the html and shows that link. The information for the word file can be gathered the same way the output is generated. I know you have no database to test, so it's a bit virtual. But I hope the concept is clear. The word output should be quite the same layout as the screenprint.
